Forward

The purpose of this manual is to describe the methodology and procedures for appraising all Madison County Real Estate at market value (and present use value, as appropriate) at the time of the county's most recent General Reappraisal. It also includes the adjustments that may be used for various types of construction and market conditions, and valuation schedules for land. The tables, rates, and ranges found in this manual are only guidelines. On a property-by-property basis, appraisers have the flexibility to adjust rates in order to appraise individual properties at market value and establish equitable and uniform values for all types of property.

General Reappraisals are conducted by applying Mass Appraisal techniques, with thorough analysis from appraisal staff and the use of computer-assisted mass appraisal (CAMA) software system. The sales comparison, cost approach, and income approach to value are all considered when applicable to appraise all real property.

Appraisal of Real Property in Madison County, NC

North Carolina General Statute 105-274 states that all real and personal property located within the jurisdiction of the State shall be subject to taxation unless it is otherwise exempted or excluded from taxation by law.

North Carolina General Statute 105-283 requires All property, real and personal, shall as far as practicable be appraised or valued at its true value in money. The words “True Value” shall be interpreted as meaning “Market Value”, that is, the price estimated in terms of money at which the property would change hands between a willing and financially able buyer and a willing seller, neither being under any compulsion to buy or to sell and both having reasonable knowledge of all the uses to which the property is adapted and for which it is capable of being used. This definition applies to both the terms “True Valur” and Market Value” when used in this manual.

North Carolina General Statute 105-283 requires each county to conduct a General Reappraisal of all real property at least once every eight (8) years unless the county is required to advance the date. General Statute 105-285 (d) states that real property shall be appraised at its “True Value” as of January 1 as of the year a General Reappraisal is conducted under GS 105-286. The effective date of each appraisal performed in accordance with this Schedule f Values is January 1, 2024, regardless of the calendar year in which the appraisal is made or the fiscal year for which ad valorem taxes are being calculated.

North Carolina General Statute 105-317 requires the Tax Assessor to create this Schedule of Values and outlines the procedures for adoption of the schedule. All appraisals of property performed under the terms of this manual are performed under the terms of this are performed for the purpose of calculating and allocating the annual ad valorem property tax assessment authorized under GS 104-274 and related statutes of Madison County, its municipalities, and other tax districts as authorized by law.

All appraisals, including those for ad valorem tax purposes, fall under the jurisdiction of the Uniform Standards of Professional Appraisal Practice (USPAP), the relevant portions of which have been included at the end of this manual.

An overview of Mass Appraisal

Mass appraisal is the process of appraising a large number of properties as of a given effective date. Using statistical analysis to arrive at uniform and equitable values. A Valuation model is developed to replicate changes in supply and demand over a large area. It is different from single-property appraisal ("fee appraisal"), in which a market analysis is performed for only the subject parcel. The same approaches to value (sales comparison, income. Cost) apply to both methods; the differences lie in the way market analysis and appraisal are performed and the quality control process.

First all recent sales are analyzed to determine if they are arm's length transactions. A transaction is considered "arm's length" if it is between two unrelated parties who are not under any unique compulsion to buy or sell, and if it is representative of the fair market value. Sales between relatives, short sales, and estate sales are examples of transactions which might not be good evidence of market value in that area.

Land is appraised based on available land sale data, allocation of sales prices between land and improvements, or other methods as appropriate.

Once land rates are established, analysis are performed to establish the positive or negative influence of various property characteristics. Base square foot rates for each type of addition, outbuilding, and internal characteristic (such as bath count or walk up attics) are determined.

The rates published in the Schedule of Values are base rates and ranges for what is considered to be average quality and workmanship and standard lots and acreage The CAMA appraisal system contains factors and adjustments that can be applied to land and building rates to recognize market conditions, functional and economical obsolescence, deferred maintenance, remodeling, poor topography, and many other characteristics which can affect supply and demand. Judgment by the appraiser plays an important role with respect to comparative grading and depreciation.

Further sales analysis is performed to confirm the valuation model is correctly producing values in line with the current market sales. The final appraised value of each property is the appraiser's opinion of the most probable price at which the property would sell on the open market as of the effective date of the appraisal. It is not the highest or lowest price it could sell for, nor is it an average price.

After the General Reappraisal

After a General Reappraisal, the Schedule of Values must remain in affect until the General Reappraisal. North Carolina General Statute 105-287 outlines the conditions under which values may and may not be changed in between General Reappraisal years. This section highlights the points that are most relevant to the majority of property owners, however the taxpayer is encouraged to review section 105-287 in its entirety for a more detailed understanding of the law. Currently, statutes can be viewed online at the North Carolina General Assembly website using the following URL:

<http://www.ncleg.net/gascripts/statutes/Statutes.asp>

The statute permits the assessor to increase or decrease the appraised value of a property based on physical changes to the land and/or improvements (105-287(a)(2b)). Common examples of this would include new additions to a home, new outbuildings (such a detached garages), demolition of existing improvements, changes to zoning, or a division of land into smaller lots.

The statute permits the assessor to increase or decrease the appraised value of a property to correct a clerical or mathematical errors, and to correct errors based on a misapplication of the Schedule of Values (105-287(a)(1) and 105-287(a)(2).

The statute prohibits the assessor from increasing or decreasing the appraised value of a property ue to inflation, deflation, or changes in the local economy (105-287(b)(2)). This allows for equity in assessments, as every property is appraised based on the economic conditions influencing the supply and demand at the same point in time.

The statute requires that all changes made in the above (and other allowed) situations be made using the current Schedule of Values.(105-287(c)). This means that when improvements are made, they are valued using the same rates and guidelines outlined in the rest of this manual until the next General Reappraisal is conducted. For example, a house built in 2026 would be appraised based on an analysis of what similar homes were selling for at the time this 2024 Schedule of Values was compiled. The cost and

market value of the home at the time of its construction would not be considered. This allows new construction to be appraised uniformly and equitably with existing construction.

North Carolina General Statute 105-317(a)(3) requires that partially completed buildings be appraised based on their degree of completion as of January 1 of the year for which the new assessment is being made.

Approaches to Value

There are three recognized approaches to appraising real property; these are the Market, Cost and Income approaches. Madison County uses all three as appropriate when performing appraisals. Not all approaches are applicable to every type of property.

The Market approach, also referred to as the Sales Comparison approach, is the most commonly used method for residential properties and the most commonly known among the general public. Stated simply, this method involves comparing the characteristics of a property being appraised to those of properties that have recently sold, adjusting the known sales prices to reflect any noted differences, and using those adjusted sales to estimate the value of the subject property.

In the Cost approach, the appraiser determines the cost to build the subject structure(s) new, including all direct and indirect costs, and then makes an allowance for depreciation based on the actual condition of the improvements. This is added to the appraiser's opinion of the value of the land to calculate a total value.

The Income approach assumes that the subject property was (or is typically) bought for its potential to produce an income stream. It estimates the present value of all future anticipated income, making allowances for operating expenses and loss of vacancy and collections (among other factors).

Highest and Best Use

Properties in Madison County are appraised based on their highest and best use, which best reflects what the property would sell for in an open market. Almost all property has the potential to be used for more than one purpose. The highest and best use is that which is the most profitable and for which the demand is the highest, thus generating the highest return for the property owner. It must be both economically feasible and physically possible. It must also be a legally permissible use. To be legally permissible, consideration must be made for zoning and similar land use restrictions (such as watersheds).

The ability to obtain a zoning change or variance is often a factor in the price a potential buyer is willing to pay, therefore both current and potential zonings and restrictions may be considered when determining the highest and best use of the parcel. The potential highest and best use must be a probable one based on supply and demand in the market: it should not be an unlikely or speculative use. The appraiser may also consider what interim uses may exist in between the present use of the property and the possible future use.

Because the highest and best use of a piece of land may not be its current use, the appraiser must consider the relationship between the highest and best use of the land and its existing improvements. These improvements may still offer an income stream, salvage value, or other benefits. A reduction in the appraised value of the improvements may be appropriate, but in some cases, the appraiser may determine that the improvements contribute no value to the property, or that the improvements are a detriment to the overall value of the property due to the expense involved in removing them.

Present Use Value

The term Value in Use refers to the value of the land or improvements for a specific purpose. Present Use applies this definition to the way a property is currently being utilized. In the case where the current use of the property is also its highest and best use, these are the same. In some cases, a separate appraised value may be calculated based on the present use of the property. This is most commonly the case with property being assessed as agricultural, horticultural, or forestland under General Statute 105-277.2 thru General Statute 105-277.7.

To qualify for Present Use Value classification, property must meet statutory requirements for ownership, size, income, and sound management. The appraiser will determine both the market value of the property based on its highest and best use and a value based on present use. Ad Valorem taxes will be calculated each year based on both figures with the owner paying on the present use value. The difference between the two tax amounts will be kept in the record each year as deferred taxes. When property becomes disqualified from the PUV program, the deferred taxes for current year and three previous years, along with accrued interest, will usually become immediately due and payable. These taxes are commonly referred to as “rollback” taxes.

Depreciation

Items which may be considered within the broad category of normal maintenance, repair, and replacement should not influence the Effective Year estimate for appraisal purposes. Such items generally do not materially increase the overall market value or extend the remaining useful life of the building. For example, a new water may temporarily influence the market price, but it does not significantly extend the life of the building.

The following tables give the base percent adjustment based on the effective age of the structure. The appraiser may make additional adjustments for functional or external obsolescence. Definitions of depreciation and obsolescence are provided below for clarity.

General areas to be considered by the appraiser in making a determination of obsolescence include; suitability or appropriateness; comfort; efficiency; safety; security; accessibility; ease and cost of maintenance; market standards; attractiveness; profitability.

Physical Depreciation

Physical depreciation is a reduction in utility due to the chemical and mechanical breaking down of improvements due to use, weathering, damage, pest or insect infestation, and deferred maintenance. Physical deterioration may be subdivided into curable and incurable components.

Curable physical depreciation is deterioration that a prudent buyer would plan to correct upon purchase of the property, and the cost of making the correction would be no more than the increase in the present worth associated with the cure. Curable physical deterioration is usually measured by the cost to cure and subtracted from the cost new.

Examples of physical deterioration include such repairable or replaceable items as worn-out roofing, broken window panes, or soiled or peeling paint.

Incurable physical depreciation is deterioration that, when looking at market conditions on the effective date of the appraisal, a prudent buyer would not feasibly or economically be justified in correcting. The test is not physical ability, but rather economic feasibility. In other words, if the cost of correcting the condition is greater than the anticipated increase in present in present worth, incurable physical depreciation is present.

Functional Obsolescence

A loss of value due to characteristics inherent within the property. This is a loss in value due to the defects in design, or caused by changes that, over time, have made some aspect of a structure obsolete by current standards. The defect may be curable or incurable. To be curable, the cost of replacing the outmoded or unacceptable aspect must be the same as or less than the anticipated increase in value. Curable functional obsolescence is measured as the cost to cure the condition. Incurable functional obsolescence may be caused by deficiency or a super-adequacy.

Examples of functional obsolescence include: excessive or deficient floor load capacity; deficient storage space; poor heating, lighting, or air-conditioning system; inadequate parking or loading facilities; multiple floors in a manufacturing facility, inhibiting efficient manufacturing process; low or excessive ceiling height; insufficient elevator service.

External Obsolescence

A loss of value due to forces outside the boundaries of the property. The diminished utility of the structure due to negative influences from outside the site is incurable. It can be caused by a variety of factors, including neighborhood decline, the property's location in a community, state or region, or market conditions.

Examples of external obsolescence include: zoning laws that affect the use or operation of the property; lack of need for this property due to changing economic conditions; a well-kept house located on land with commercial zoning; oversupply of a type of property; a very large house located in a neighborhood of small houses; a house located near a busy street or highway.

Grade Specifications

AA

Buildings generally having the highest quality of architectural style and design, constructed with the finest quality materials and workmanship. Superior quality of interior finish and features.

A

Buildings generally having excellent quality materials and workmanship throughout. Excellent quality of interior finish and features.

B

Buildings generally having above average quality materials and workmanship throughout. Above average quality of interior finish and features.

C

Buildings generally having average quality of materials and workmanship throughout. Average quality of interior finish and features.

D

Buildings generally having below average quality materials and workmanship throughout. Below average quality of interior finish and features.

E

Buildings generally having low-quality materials and workmanship throughout. Very low quality of interior and features.
