

Who Needs a Third COVID-19 Vaccine Dose?

Currently, CDC is recommending that moderately to severely immunocompromised people receive a third dose.

This includes people who have:

- 1 Been receiving active cancer treatment for tumors or cancers of the blood
- 2 Received an organ transplant and are taking medicine to suppress the immune system
- 3 Received a stem cell transplant within the last 2 years or are taking medicine to suppress the immune system
- 4 Moderate or severe primary immunodeficiency (such as DiGeorge syndrome, Wiskott-Aldrich syndrome)
- 5 Advanced or untreated HIV infection
- 6 Active treatment with high-dose corticosteroids or other drugs that may suppress your immune response

***Individuals with other underlying health conditions must wait for FDA approval to get 3rd doses 8 months after their 2nd dose. This is **Not** occurring at this time.
